

PRESS RELEASE

Infonoia Announces IBM Partnership

Infonoia has become IBM Partner for delivering composite applications to enterprises in Western Switzerland

Geneva, Switzerland, 27 September 2006 - Infonoia, a professional organization providing software and services surrounding enterprise open-source Java solutions, announced today its agreement with IBM to become an IBM Partner for delivering composite applications to enterprises in Western Switzerland.

The Infonoia - IBM partnership will help enterprises build server-based applications that optimize business processes and solve specific business problems fast, cost-effectively and sustainably.

Infonoia is committed to contributing its leading-edge expertise in server-side Eclipse and OSGi technology to deploy composite web applications that are based on IBM software and Rich Server Platform (RSP). Its services will include consulting, development, support, maintenance and training.

Rich Server Platform (RSP) is next-generation, yet standards-based, open-source software that allows clients to

- optimize business processes through deep integration of components thanks to the OSGi specifications;
- increase responsiveness of server-based applications through hybrid deployment on the server- and the client-side;
- meet special and diverse business requirements through rich user interfaces that integrate a range of established web technologies;
- integrate people, processes, content and components into composite web applications fast and easily through plug-and-play Eclipse technology.

Infonoia partners with IBM because of its comprehensive software portfolio and because the company is committed to open standards and open-source technology. IBM participates in and contributes to more than 150 open-source projects, including Eclipse and Apache. IBM WebSphere Portal, for instance, is based on Java Platform, Enterprise Edition (Java EE) and uses Eclipse Rich Client Platform.

"By partnering with IBM, we broaden our solution offerings to solve our clients' diverse and specific business problems", said Wolfgang Gehner, Infonoia's Chief Executive Officer.

About Infonoia

Infonoia - a merge of the words information and paranoia - is a software and services company headquartered in Geneva, Switzerland. The company specializes in Java web applications and open source, and is leading the open-source project Rich Server Platform (RSP). A server-side Eclipse application, which Infonoia implemented for the World Health Organization, has won the *Open Source Best Practice Award*.
